

Instructions after cryotherapy

Dear Mrs. / Mr

Your skin condition was cured with cryotherapy (liquid nitrogen). This technique destroys the lesion with very low temperatures, well below zero. The burning you felt during the treatment may take a little longer. If later you feel pain, you can take analgesic. The point cryotherapy was done will appear red and swollen. In one or two days may occur a bubble filled with liquid. If large bubbles appear, you can empty them with a sterile needle. Today don't wash the skin, while you put antibiotic ointment prescribed for 7-10 days. At place of treatment after 7-10 days a scab (crust) will form, which will fall out. If you have any questions, do not hesitate to contact us and do not forget that you may need to repeat the treatment after 3-4 weeks.
